#### Abstract

In this paper, we represent an intuitionistic fuzzy vector space as the Cartesian product of its membership parts and its non membership parts. By using this representation, the standard basis of intuitionistic fuzzy vector space is defined and we have shown that any two basis for a finitely generated subspace over intuitionistic fuzzy algebra (IF) have the same cardinality. Also we prove that any finitely generated subspace of $\mathrm{V}_{\mathrm{n}}$ over the intuitionistic fuzzy algebra(IF) has a unique standard basis.

Keywords: Fuzzy matrix, Intuitionistic fuzzy matrix, Intuitionistic fuzzy vector space, Standard basis.

## AMS Mathematics Subject Classification (2010):

## 1. Introduction

Atanassov has introduced and developed the concept of intuitionistic fuzzy sets as a generalization of fuzzy sets [1]. If $\mathrm{A}=\left(a_{i j}\right) \in(I F)_{m x n}$, then $\mathrm{A}=\left(\left\langle a_{i j \mu}, a_{i j \nu}\right\rangle\right)$, where $a_{i j \mu}$ and $a_{i j \nu}$ are the membership values and non membership values of $a_{i j}$ in A respectively with respect to the fuzzy sets $\mu$ and $v$, maintaining the condition 0 $\leq a_{i j \mu}+a_{i j \nu} \leq 1$. We deal with fuzzy matrices that is, matrices over the fuzzy algebra $\mathrm{F}^{\mathrm{M}}$ and $\mathrm{F}^{\mathrm{N}}$ with support $[0,1]$ and fuzzy operations $\{+,$.$\} defined as \mathrm{a}+\mathrm{b}=\max \{\mathrm{a}$, $b\}, a \cdot b=\min \{a, b\}$ for all $a, b \in F^{M}$ and $a+b=\min \{a, b\}, a . b=\max \{a, b\}$ for all $a$, $\mathrm{b} \in \mathrm{F}^{\mathrm{N}}$. Let $\mathrm{F}_{m x n}^{M}$ be the set of all mxn Fuzzy matrices over F . A matrix $\mathrm{A} \in \mathrm{F}_{m x n}^{M}$ is said to be regular if there exists $X \in F_{n x m}^{M}$ such that $A X A=A, X$ is called a generalized inverse (g-inverse) of A. In [3], Kim and Roush have established that any finitely generated subspace of $\mathrm{V}_{\mathrm{n}}$ over the Fuzzy algebra $\{0,1\}$ has a unique basis. Cho [2] has discussed the consistency of fuzzy relational equations of the form $x A=b$, where $A$ is regular. If $A$ is regular with a g-inverse $X$, then $b$. $X$ is a solution of $x A=b$. For more details on fuzzy matrices one may refer [4]. In [6], we

## Standard basis of Intuitionistic Fuzzy Vector Spaces

have studied the structure of row space and column space of intuitionistic fuzzy matrices. The maximum and minimum solutions of fuzzy relational equations involving membership and non- membership matrix of the intuitionistic fuzzy matrix are determined in [7].

In this paper, we define a standard basis and prove that any finitely generated subspace of $\mathrm{V}_{\mathrm{n}}$ over the intuitionistic fuzzy algebra (IF) has a unique standard basis and determine the unique standard linear combination of a vector in terms of the standard basis vectors, as a generalization of the results on fuzzy vector space found in [5].

## 2. Preliminaries

Let $(I F)_{m x n}$ be the set of all intuitionistic fuzzy matrices of order mxn. First we shall represent $\mathrm{A} \in(I F)_{\text {mxn }}$ as Cartesian product of fuzzy matrices. The Cartesian product of any two matrices $\mathrm{A}=\left(a_{i j}\right)_{m \times n}$ and $\mathrm{B}=\left(b_{i j}\right)_{m \times n}$, denoted as $\langle A, B\rangle$ is defined as the matrix whose $\mathrm{ij}^{\text {th }}$ entry is the ordered pair $\langle A, B\rangle=\left(\left\langle a_{i j}, b_{i j}\right\rangle\right)$. For $A=\left(a_{i j}\right)_{m \times n}=\left(\left\langle a_{i j \mu}, a_{i j \nu}\right\rangle\right)$. We define $A_{\mu}=\left(a_{i j \mu}\right) \in \mathrm{F}_{m \times n}^{M}$ as the membership part of A and $A_{v}=\left(a_{i j v}\right) \in \mathrm{F}_{m x n}^{N}$ as the non membership part of A. Thus A is the Cartesian product of $A_{\mu}$ and $A_{\nu}$ written as $A=\left\langle A_{\mu}, A_{\nu}\right\rangle$ with $A_{\mu} \in \mathrm{F}_{m x n}^{M}, A_{\nu} \in$ $\mathrm{F}_{m \times n}^{N}$.

We shall follow the matrix operations on intuitionistic fuzzy matrices as defined in our earlier work [6].

For $A, B \in(I F)_{m x n}$, if $A=\left\langle A_{\mu}, A_{v}\right\rangle$ and $B=\left\langle B_{\mu}, B_{v}\right\rangle$, then

$$
\begin{gather*}
A+B=\left\langle A_{\mu}+B_{\mu}, A_{v}+B_{v}\right\rangle  \tag{2.1}\\
A B=\left\langle A_{\mu} \cdot B_{\mu}, A_{v} \cdot B_{v}\right\rangle \tag{2.2}
\end{gather*}
$$

$A_{\mu} \cdot B_{\mu}$ is the max min product in $\mathrm{F}_{m \times n}^{M}$,
$A_{v} \cdot B_{v}$ is the min max product in $\mathrm{F}_{m \times n}^{N}$.
Let us define the order relation on (IF) mxn as ,

$$
\begin{equation*}
A \leq B \Leftrightarrow a_{i j \mu} \leq b_{i j \mu} \text { and } a_{i j \nu} \geq b_{i j \nu} \text {, for alli and } \mathrm{j} \tag{2.3}
\end{equation*}
$$

Let us consider the intuitionistic fuzzy relational equation of the form $\mathrm{xA}=\mathrm{b}$, where $A$ is a intuitionistic fuzzy matrix of order $m x n$ and $b$ is the intuitionistic fuzzy vector and $\Omega(\mathrm{A}, \mathrm{b})$ be the set of all solutions of the equation $\mathrm{xA}=\mathrm{b}$.

Lemma 2.1[4]. Let $\mathrm{x} A_{\mu}=b_{\mu}, A_{\mu} \in \mathrm{F}_{m x n}^{M}, b_{\mu} \in \mathrm{F}_{1 x n}^{M}$, if $\left.\Omega\left(A_{\mu}, b_{\mu}\right)\right) \neq \phi$, then it has a unique maximum solution.

## T. Gandhimathi

Lemma 2.2[7]. Let $x A_{v}=b_{v}, A_{v} \in \mathrm{~F}_{m x n}^{N}, b_{v} \in \mathrm{~F}_{1 x n}^{N}$, if $\Omega\left(A_{v}, b_{v}\right) \neq \phi$, then it has a unique minimum solution.

Lemma 2.3[7]. If $\mathrm{xA}=\mathrm{b}, A \in(\mathrm{IF})_{\mathrm{mxn}}, \mathrm{b} \in(\mathrm{IF})_{1 \mathrm{xn}}$ is consistent, then it has a unique maximum solution of the form $\hat{x}=<\hat{x}_{\mu}, \breve{x}_{v}>$, where $\hat{x}_{\mu}$ is the unique maximum solution of $x A_{\mu}=b_{\mu}$ and $\breve{x}_{v}$ is the unique minimum solution of $x A_{v}=b_{v}$.

Definition 2.1[4]. A basis $C$ over the max min fuzzy algebra $F^{M}$ is a standard basis iff whenever $c_{i}=\sum a_{i j} c_{j}$ for $c_{i}, c_{j} \in C$ and $a_{i j} \in F^{M}$ then $a_{i j} c_{i}=c_{i}$. In the same manner, A basis $C$ over the minmax fuzzy algebra $F^{N}$ is a standard basis iff whenever $c_{i}=\sum$ $a_{i j} c_{j}$ for $c_{i}, c_{j} \in C$ and $a_{i j} \in F^{N}$ then $a_{i i} c_{i}=c_{i}$.

Lemma 2.4[3]. Any two basis for a finitely generated subspace of the maxmin fuzzy algebra $\mathrm{F}^{\mathrm{M}}=[0,1]$, have the same cardinality and any finitely generated subspace over $\mathrm{F}^{\mathrm{M}}$ has a unique standard basis.

## 3. Standard basis

In this section, we define a standard basis and prove that any finitely generated subspace of $\mathrm{V}_{\mathrm{n}}$ over the intuitionistic fuzzy algebra(IF) has a unique standard basis.

Let us take any finite subspace W over an intuitionistic fuzzy vector $\operatorname{space}\left(\mathrm{V}_{\mathrm{n}}\right)$. W can be expressed as $\mathrm{W}=<\mathrm{W}^{\mathrm{M}}, \mathrm{W}^{\mathrm{N}}>$, where $\mathrm{W}^{\mathrm{M}}$ and $\mathrm{W}^{\mathrm{N}}$ are finite subspaces over the max min fuzzy algebra $\mathrm{F}^{\mathrm{M}}$ and the min max fuzzy algebra $\mathrm{F}^{\mathrm{N}}$ respectively. By lemma (2.4), $\mathrm{W}^{\mathrm{M}}$ has a unique standard basis. In the same manner, it can be proved that $\mathrm{W}^{\mathrm{N}}$ has a unique standard basis over $\mathrm{F}^{\mathrm{N}}$.

Definition 3.1. A basis $C$ over the intuitionistic fuzzy algebra (IF) is a standard basis iff whenever $c_{i}=\sum a_{i j} c_{j}$ for $c_{i}, c_{j} \in C$ then $a_{i j} c_{i}=c_{i}$. If $a_{i j}=<a_{i j \mu}, a_{i j v}>\in$ (IF) and $\left.c_{i}=<c_{i \mu}, c_{i v}\right\rangle$, for $c_{i \mu} \in F^{M}, c_{i v} \in F^{N}$,then $a_{i j} c_{i}=c_{i}$. This implies that $a_{i i} c_{i \mu}=c_{i \mu}$ and $\mathrm{a}_{\mathrm{i}} \mathrm{c}_{\mathrm{iv}}=\mathrm{c}_{\mathrm{iv}}$.

Theorem 3.1. Any two basis for a finitely generated subspace of the intuitionistic fuzzy algebra (IF) $=<\mathrm{F}^{\mathrm{M}}, \mathrm{F}^{\mathrm{N}}>$ have the same cardinality and any finitely generated subspace over (IF) has a unique standard basis.
Proof. We first show that for any finite basis C of an intuitionistic fuzzy vector space W of (IF), there exist a standard basis having the same cardinality.

Let $\left.\mathrm{C}=<\mathrm{C}_{\mu}, \mathrm{C}_{v}\right\rangle$ be the representation of C and S be the set of all intuitionistic fuzzy vectors each of whose entries equals some entry of a vector of C . Then $S$ is a finite set. Suppose $C$ is a not a standard basis, then $c_{i}=\sum a_{i j} c_{j}$ for $c_{i}, c_{j} \in$ $C$ and $a_{i j}=<a_{i j \mu}, a_{i j v}>\in($ IF $)$ with $a_{i j} c_{i} \neq c_{i}$, then we have the following:
(i) $\mathrm{a}_{\mathrm{ii}} \mathrm{c}_{\mathrm{i} \mu} \neq \mathrm{c}_{\mathrm{i} \mu}$ and $\mathrm{a}_{\mathrm{ii}} \mathrm{c}_{\mathrm{iv}} \neq \mathrm{c}_{\mathrm{iv}}$, (ii) $\mathrm{a}_{\mathrm{ii}} \mathrm{c}_{\mathrm{i} \mu} \neq \mathrm{c}_{\mathrm{i} \mu}$ and $\mathrm{a}_{\mathrm{ii}} \mathrm{c}_{\mathrm{iv}}=\mathrm{c}_{\mathrm{iv}}$ and
(iii) $\mathrm{a}_{\mathrm{ij}} \mathrm{c}_{i \mu}=\mathrm{c}_{\mathrm{i} \mu}$ and $\mathrm{a}_{\mathrm{ij}} \mathrm{c}_{\mathrm{iv}} \neq \mathrm{c}_{\mathrm{iv}}$.

## Standard basis of Intuitionistic Fuzzy Vector Spaces

Here let us take more general case(i), $\mathrm{c}_{\mathrm{i} \mu} \neq \min \left\{\mathrm{a}_{\mathrm{ij}, \mathrm{c}}\right\}$ and $\mathrm{c}_{\mathrm{iv}} \neq \max \left\{\mathrm{a}_{\mathrm{i} i}, \mathrm{c}\right\}$. Therefore $\mathrm{a}_{\mathrm{ij}} \mathrm{c}_{\mathrm{i} \mu}<\mathrm{c}_{\mathrm{i} \mu}$ and $\mathrm{a}_{\mathrm{iji}} \mathrm{c}_{\mathrm{iv}}>\mathrm{c}_{\mathrm{iv}}$.

Let $\mathrm{C}_{\mu}{ }^{\prime}$ be the set obtained from $\mathrm{C}_{\mu}$ by replacing $\mathrm{c}_{\mathrm{i} \mu}$ by $\mathrm{a}_{\mathrm{ii}} \mathrm{C}_{i \mu}$ and $\mathrm{C}_{v}{ }^{\prime}$ be the set obtained from $\mathrm{C}_{\mathrm{v}}$ by replacing $\mathrm{c}_{\mathrm{iv}}$ by $\mathrm{a}_{\mathrm{ii}} \mathrm{c}_{\mathrm{iv} \text {. }}$ Then $\left|\mathrm{C}_{\mu}{ }^{\prime}\right|=\left|\mathrm{C}_{\mu}\right|$ and $<\mathrm{C}_{\mu}{ }^{\prime}>=<\mathrm{C}_{\mu}>$ and $\left|\mathrm{C}_{v}\right|=\left|\mathrm{C}_{v}\right|$ and $\left.\left\langle\mathrm{C}_{v}\right\rangle=<\mathrm{C}_{v}\right\rangle$ and it can be verified that $\mathrm{C}_{\mu}$ and $\mathrm{C}_{v}$ are independent set and all the vectors of $\mathrm{C}_{\mu}{ }^{\prime}$ and $\mathrm{C}_{v}{ }^{\prime}$ are all in S.

Let us define an order relation on finite subsets of $S$ as follows:
Let the weight of a finite subset be the sum of all entries of members of the subset regarded as real numbers. We define that $F_{1} \leq F_{2}$ for finite subsets $F_{1}$ and $F_{2}$ of $S$ then by (2.3) we get, $\mathrm{F}_{1 \mu} \leq \mathrm{F}_{2 \mu}$ and $\mathrm{F}_{1 v} \geq \mathrm{F}_{2 v}$ for finite subsets $\mathrm{F}_{1 \mu}, \mathrm{~F}_{2 \mu}, \mathrm{~F}_{1 v}$ and $F_{2 v}$ of $S$ if weight of $F_{1 \mu} \leq$ weight of $F_{2 \mu}$ and weight of $F_{1 v} \geq$ weight of $F_{2 v}$. Clearly this is a partial order relation on finite subsets of S. Since $a_{i i} c_{i \mu}<c_{i \mu}$ and $\mathrm{a}_{\mathrm{iji}} \mathrm{c}_{\mathrm{iv}}>\mathrm{c}_{\mathrm{iv}}, \mathrm{C}_{\mu} \leq \mathrm{C}_{\mu}$ and $\mathrm{C}_{\mathrm{v}}^{\prime} \geq \mathrm{C}_{\mathrm{v}}$. This implies that $\mathrm{C}^{\prime} \leq \mathrm{C}$. Hence $\left|\mathrm{C}^{\prime}\right|=|\mathrm{C}|$ is finite.

If $\mathrm{C}^{\prime}$ is a standard basis, then $\mathrm{C}^{\prime}$ is the required standard basis with the same cardinality as C. If not then repeat the process of replacing $C^{\prime}$ by a basis $C^{\prime \prime}$ and proceed. Therefore after replacing basis of the form C by a basis of the form C the process must terminate after a finite number of steps.

This can happen only if we have obtained a standard basis with the same cardinality as C . This proves that for finite basis, there exists a standard basis with the same cardinality. Further corresponding to the standard basis $\mathrm{c}=\left\{\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{n}}\right\}$ for the subspace $\mathrm{W}=<\mathrm{W}^{\mathrm{M}}, \mathrm{W}^{\mathrm{N}}>$ we have the standard basis $\mathrm{c}_{\mu}=\left\{\mathrm{c}_{1 \mu}, \mathrm{c}_{2 \mu}, \ldots, \mathrm{c}_{\mathrm{n} \mu}\right\}$ for $\mathrm{W}^{\mathrm{M}}$ and $c_{v}=\left\{c_{1 v}, c_{2 v}, \ldots, c_{n v}\right\}$ for $W^{N}$. The uniqueness of $C$ follows from the uniqueness of the standard basis $\mathrm{c}_{\mu}$ and $\mathrm{c}_{v}$ for $\mathrm{W}^{\mathrm{M}}$ and $\mathrm{W}^{\mathrm{N}}$ respectively[Refer lemma(2.4)].Hence the proof.

Definition 3.2. The dimension of the finitely generated subspace $S$ of a intuitionistic fuzzy vector space $V_{n}$ over the intuitionistic fuzzy algebra(IF) denoted by $\operatorname{dim}(S)$ is defined to be the cardinality of the standard basis of S.

Example 3.1. The set $\{(<1,0>,<0,1>,<0,1>), \quad(<0,1>,<1,0\rangle,<0,1>)$, $(<0,1>,<0,1>,<1,0>)\}$ forms the standard basis of $\mathrm{V}_{3}$.

Theorem 3.2. Let $S$ be a finitely generated subspace of $V_{n}$ and let $c=\left\{c_{1}, c_{2}, \ldots ., c_{n}\right\}$ be the standard basis for S . Then any vector $\mathrm{x} \in \mathrm{S}$ can be expressed uniquely as a linear combination of the standard basis.
Proof. Since $\left\{\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{n}}\right\}$ is the standard basis for $\mathrm{S}=\left\langle\mathrm{S}_{\mu}, \mathrm{S}_{\downarrow}\right\rangle$, then by theorem(3.1), $\mathrm{c}_{\mu}=\left\{\mathrm{c}_{1 \mu}, \mathrm{c}_{2 \mu}, \ldots, \mathrm{c}_{n \mu}\right\}$ and $\mathrm{c}_{v}=\left\{\mathrm{c}_{1 v}, \mathrm{c}_{2 v}, \ldots ., \mathrm{c}_{n v}\right\}$ are the standard basis for $S_{\mu}$ and $S_{v}$ respectively. x is a linear combination of the standard basis vectors.

Let $\mathrm{x}=\sum \beta_{\mathrm{j}} \mathrm{c}_{\mathrm{j}}$, where $\mathrm{x}=\left\langle\mathrm{x}_{\mu}, \mathrm{x}_{v}\right\rangle, \mathrm{c}_{\mathrm{j}}=\left\langle\mathrm{c}_{\mathrm{j} \mu}, \mathrm{c}_{\mathrm{jv}}\right\rangle$. Then

$$
\begin{equation*}
\mathrm{x}_{\mu}=\sum_{j}^{n} \beta_{\mathrm{j}} \mathrm{c}_{\mathrm{j} \mu}, \beta_{\mathrm{j}} \in \mathrm{~F}^{\mathrm{M}} \text { and } \tag{3.1}
\end{equation*}
$$

## T. Gandhimathi

$$
\begin{equation*}
\mathrm{x}_{\mathrm{v}}=\sum_{j}^{n} \alpha_{\mathrm{j}} \mathrm{c}_{\mathrm{jv}}, \alpha_{\mathrm{j}} \in \mathrm{~F}^{\mathrm{N}} . \tag{3.2}
\end{equation*}
$$

In this expression the coefficients $\beta_{j} \mathrm{~s}$ and $\alpha_{\mathrm{j}} \mathrm{s}$ are not unique. If we write (3.1) in the matrix form as $x_{\mu}=\left(\beta_{1}, \beta_{2, \ldots}, \beta_{\mathrm{n}}\right) . \mathrm{C}_{\mu}$. Where $\mathrm{C}_{\mu}$ is the matrix whose rows are the basis vectors $\left\{\mathrm{c}_{1 \mu}, \mathrm{c}_{2 \mu}, \ldots, \mathrm{c}_{\mathrm{n} \mu}\right\}$ then $\mathrm{x}_{\mu}=\mathrm{p} . \mathrm{C}_{\mu}$ has a solution $\left(\beta_{1,}, \beta_{2, \ldots}, \beta_{\mathrm{n}}\right)$. Hence $\Omega\left(\mathrm{C}_{\mu}, \mathrm{x}_{\mu}\right) \neq \Phi$ and by lemma(2.1), it follows that this equation has a unique maximal solution ( $p_{1}, p_{2}, \ldots \ldots, p_{n}$ ) (say).

In the same manner, if (3.2) is written in the matrix form as $x_{v}=\left(\alpha_{1}, \alpha_{2}, \ldots, \alpha\right.$ $\left.{ }_{n}\right) . \mathrm{C}_{v}$. Where $\mathrm{C}_{v}$ is the matrix whose rows are the basis vectors $\left\{\mathrm{c}_{1 v}, \mathrm{c}_{2 v}, \ldots, \mathrm{c}_{\mathrm{nv}}\right\}$ then $\mathrm{x}_{v}=\mathrm{q} \cdot \mathrm{C}_{v}$ has a solution $\left(\alpha_{1}, \alpha_{2}, \ldots, \alpha_{\mathrm{n}}\right)$. Hence $\Omega\left(\mathrm{C}_{\mathrm{v}}, \mathrm{x}_{v}\right) \neq \Phi$ and by lemma(2.2), it follows that this equation has a unique minimal solution $\left(q_{1}, q_{2}, \ldots \ldots, q_{n}\right)($ say $)$. Thus x $=\left\langle\mathrm{x}_{\mu}, \mathrm{x}_{\nu}\right\rangle$, where

$$
\mathrm{x}_{\mu}=\sum_{j \neq}^{n} \mathrm{p}_{\mathrm{j}} \mathrm{c}_{\mathrm{j}} \text { with } \mathrm{p}_{\mathrm{j}} \in \mathrm{~F}^{\mathrm{M}} \text { and } \mathrm{x}_{\mathrm{v}}=\sum_{j}^{n} \mathrm{q}_{\mathrm{j}} \mathrm{c}_{\mathrm{j}} \text { with } \quad \mathrm{q}_{\mathrm{j}} \in \mathrm{~F}^{\mathrm{N}} \quad \text { is the unique }
$$

representation of the intuitionistic fuzzy vector $x$. Hence the proof.
Theorem 3.3. Let $\left\{\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{n}}\right\}$ be the standard basis of the subspace W in $\mathrm{V}_{\mathrm{n}}$. In the standard fuzzy linear combination of the basis vector $c_{i}$, the $i^{\text {th }}$ coefficient of $c_{i}$ is $\langle 1,0\rangle$.
Proof. Let us compute the standard fuzzy linear combination of the basis vector $\mathrm{c}_{\mathrm{i}}=$ $<\mathrm{c}_{\mathrm{i} \mu}, \mathrm{c}_{\mathrm{iv}}>$ in terms of the standard basis $\left\{\mathrm{c}_{1}, \mathrm{c}_{2}, \ldots, \mathrm{c}_{\mathrm{n}}\right\}$. Since $\mathrm{c}_{\mathrm{i}} \in \mathrm{V}_{\mathrm{n}}$, let $\mathrm{c}_{\mathrm{i}}=<\mathrm{c}_{\mathrm{i} \mu}, \mathrm{c}_{\mathrm{iv}}$ $\left.\left.>=\left(<\mathrm{c}_{\mathrm{i} 1 \mu}, \mathrm{c}_{\mathrm{i} 1 \mathrm{v}}\right\rangle,<\mathrm{c}_{\mathrm{i} 2 \mu}, \mathrm{c}_{\mathrm{i} 2 \downarrow}\right\rangle, \ldots,<\mathrm{c}_{\mathrm{in} \mathrm{\mu}}, \mathrm{c}_{\mathrm{inv}}>\right)$, for each $\mathrm{i}=1,2, \ldots \ldots, \mathrm{n}$.
$\left.\left.\mathrm{c}_{\mathrm{i}}=<\mathrm{c}_{\mathrm{i} \mu}, \mathrm{c}_{\mathrm{iv}}>=\hat{x}_{1}<\mathrm{c}_{1 \mu,} \mathrm{c}_{1 v}\right\rangle+\hat{x}_{2}<\mathrm{c}_{2 \mu}, \mathrm{c}_{2 v}\right\rangle+\ldots .+\hat{x}_{n}<\mathrm{c}_{\mathrm{n} \mu}, \mathrm{c}_{\mathrm{nv}}>$. This implies $\mathrm{c}_{i \mu}=\hat{x}_{1} \mathrm{c}_{1 \mu}+\hat{x}_{2} \mathrm{c}_{2 \mu}+\ldots .+\hat{x}_{n} \mathrm{c}_{\mathrm{n} \mu}$ and $\mathrm{c}_{\mathrm{iv}}=\hat{x}_{1} \mathrm{c}_{1 \mathrm{v}}+\hat{x}_{2} \mathrm{c}_{2 v}+\ldots .+\hat{x}_{n} \mathrm{c}_{\mathrm{nv}}$ are the standard fuzzy linear combination. This can be expressed as intutitionistic fuzzy relational equation $\mathrm{xA}=\mathrm{b}$, where $\mathrm{b}=\left\langle\mathrm{b}_{\mu}, \mathrm{b}_{v}\right\rangle=\left(\left\langle\mathrm{c}_{\mathrm{i} 1 \mu}, \mathrm{c}_{\mathrm{i} 1 \nu}\right\rangle,\left\langle\mathrm{c}_{\mathrm{i} 2 \mu}, \mathrm{c}_{\mathrm{i} 2 \nu}\right\rangle, \ldots .,<\right.$ $\mathrm{c}_{\mathrm{in} \mathrm{\mu}}, \mathrm{c}_{\mathrm{inv}}>$ ), $\mathrm{x}=\left(\hat{x}_{1}, \hat{x}_{2}, \ldots ., \hat{x}_{n}\right)$ and

Let us find the maximum solution of the intuitionistic fuzzy relational equation $\mathrm{xA}=\mathrm{b}$ by using lemma (2.3). The maximum solution $\mathrm{x}=\left(\hat{x}_{1}, \hat{x}_{2}, \ldots, \hat{x}_{n}\right)$ is determined by

$$
\begin{aligned}
& \hat{x}=<\min \sigma\left(a_{j k \mu}, b_{k \mu}\right), \quad \max \sigma\left(a_{j k v}, b_{k v}\right)> \\
& k \in K \quad k \in K \\
& b_{k \mu} \text { if } a_{j k \mu}>b_{k \mu} \quad b_{k v} \text { if } a_{j f_{j v}}<b_{k v}
\end{aligned}
$$

where $\sigma\left(a_{j k \mu}, b_{k \mu}\right)=1$ etherwise and $\sigma\left(a_{j k v}, b_{k v}\right)=0$ otherwise

$$
\begin{aligned}
\hat{x}_{i}= & <\min \left\{\sigma\left(\mathrm{a}_{\mathrm{i} 1 \mu}, \mathrm{~b}_{1 \mu}\right), \sigma\left(\mathrm{a}_{\mathrm{i} 2 \mu}, \mathrm{~b}_{2 \mu}\right), \ldots, \sigma\left(\mathrm{a}_{\mathrm{in} \mu}, \mathrm{~b}_{\mathrm{n} \mu}\right)\right\}, \\
& \max \left\{\sigma\left(\mathrm{a}_{\mathrm{i} 1 v}, \mathrm{~b}_{1 v}\right), \sigma\left(\mathrm{a}_{\mathrm{i} 2 v}, \mathrm{~b}_{2 v}\right), \ldots, \sigma\left(\mathrm{a}_{\mathrm{inv}}, \mathrm{~b}_{\mathrm{n} v}\right)\right\}> \\
= & <\min \left\{\sigma\left(\mathrm{c}_{\mathrm{i} 1 \mu}, \mathrm{c}_{\mathrm{i} 1 \mu}\right), \sigma\left(\mathrm{c}_{\mathrm{i} 2 \mu}, \mathrm{c}_{\mathrm{i} 2 \mu}\right), \ldots, \sigma\left(\mathrm{c}_{\mathrm{in} \mu}, \mathrm{c}_{\mathrm{in} \mu}\right)\right\}, \\
& \quad \max \left\{\sigma\left(\mathrm{c}_{\mathrm{i} 1 v}, \mathrm{c}_{\mathrm{i} 1 v}\right), \sigma\left(\mathrm{c}_{\mathrm{i} 2 v}, \mathrm{c}_{\mathrm{i} 2 v}\right), \ldots, \sigma\left(\mathrm{c}_{\mathrm{inv}}, \mathrm{c}_{\mathrm{inv}}\right)\right\}> \\
= & <\min \{1,1, \ldots, 1\}, \max \{0,0, \ldots, 0\}> \\
\hat{x}_{i}= & <1,0>\text {. Hence the proof. }
\end{aligned}
$$

Illustration 3.2. Let us compute the standard fuzzy linear combination of the basis vector $\mathrm{C}_{1}=(<0.5,0.0>,<0.5,0.5>,<0.5,0.0>)$ in terms of the standard basis vector $\mathrm{B}=\{(<0.5,0.0>,<0.5,0.5>,<0.5,0.0>),(<0.0,1.0>,<1.0,0.0>,<0.5,0.5>)$, $(<0.0,1.0>,<0.5,0.5>,<1.0,0.0>)\}$ of the subspace W of $\mathrm{V}_{3}$ generated by B.

Let $\quad(<0.5,0.0>,<0.5,0.5>,<0.5,0.0>)=\hat{x}_{1}(<0.5,0.0>,<0.5,0.5>,<0.5,0.0>)+$ $\left.\left.\left.\hat{x}_{2}(<0.0,1.0\rangle,<1.0,0.0\right\rangle,<0.5,0.5>\right)+\hat{x}_{3}(<0.0,1.0\rangle,<0.5,0.5>,<1.0,0.0>\right)$.

$$
=\left(\hat{x}_{1}, \hat{x}_{2}, \hat{x}_{3}\right) \begin{array}{ccc}
<0.5,0.0> & <0.5,0.5> & <0.5,0.0> \\
<0.0,1.0> & <1.0,0.0> & <0.5,0.5> \\
<\phi .0,1.0> & <0.5,0.5> & <1.0,0.0>
\end{array}
$$

The above expression is of the form $\mathrm{xA}=\mathrm{b}$. Where $\mathrm{b}=(<0.5,0.0\rangle,<0.5,0.5>$ ,<0.5,0.0>),
$\begin{aligned} & \mathrm{x}=\left(\hat{x}_{1}, \hat{x}_{2}, \hat{x}_{3}\right) \text { and } \mathrm{A}= \\ & \\ & \text { Here } \mathrm{b}_{1 \mu}=\mathrm{b}_{2 \mu}=\mathrm{b}_{3 \mu}=0.5, \begin{array}{lll}0.5,0.0> & <0.5,0.5> & <0.5,0.0> \\ 0.0,1.0> & <1.0,0.0> & <0.5,0.5> \\ 0.0,1.0> & <0.5,0.5> & <1.0,0.0> \\ \mathrm{b}_{1 \mathrm{v}}=\mathrm{b}_{3 \mathrm{v}}=0.0, \mathrm{~b}_{2 \mathrm{v}}=0.5 \text { and } \mathrm{a}_{11 \mu}=\mathrm{a}_{12 \mu}=\mathrm{a}\end{array}{ }_{3 \mu}=\mathrm{a}_{23 \mu}=\mathrm{a}_{32 \mu}=\end{aligned}$ $0.5, \mathrm{a}_{21 \mu}=\mathrm{a}_{31 \mu}=0.0, \mathrm{a}_{22 \mu}=\mathrm{a}_{33 \mu}=1.0, \mathrm{a}_{11 v}=\mathrm{a}_{13 v}=\mathrm{a}_{22 v}=\mathrm{a}_{33 v}=0.0, \mathrm{a}_{12 v}=\mathrm{a}_{23 v}=\mathrm{a}_{32 v}$ $=0.5, \mathrm{a}_{21 \mathrm{v}}=\mathrm{a}_{31 \mathrm{v}}=1.0$.
Let us find the maximum solution $\mathrm{x}=\left(\hat{x}_{1}, \hat{x}_{2}, \hat{x}_{3}\right)$ of $\mathrm{xA}=\mathrm{b}$, by using lemma(2.3).
$\hat{x}=<\min \sigma\left(a_{j k \mu}, b_{k \mu}\right), \quad \max \sigma\left(a_{j k v}, b_{k v}\right)>$

$$
k \in K \quad k \in K
$$

for $\mathrm{j}=1,2,3$ and $\mathrm{k} \in \mathrm{K} \quad=\{1,2,3\}$.
For $\mathrm{j}=1, \hat{x}_{1}=<\min \sigma\left(a_{1 k \mu}, b_{k \mu}\right), \quad \max \sigma\left(a_{1 k v}, b_{k v}\right)>$

$$
k \in K \quad k \in K
$$

## T. Gandhimathi

$$
\begin{aligned}
& =<\min \{1.0,1.0,1.0\}, \max \{0.0,0.0,0.0\}> \\
& =<1.0,0.0>
\end{aligned}
$$

For $\mathrm{j}=2, \hat{x}_{1}=<\min \sigma\left(a_{2 k \mu}, b_{k \mu}\right), \quad \max \sigma\left(a_{2 k v}, b_{k v}\right)>$

$$
k \in K \quad k \in K
$$

$$
=<\min \{1.0,0.5,1.0\}, \max \{0.0,0.5,0.0\}>
$$

$$
=<0.5,0.5>
$$

For $\mathrm{j}=3, \hat{x}_{1}=<\min \sigma\left(a_{3 k \mu}, b_{k \mu}\right), \quad \max \sigma\left(a_{3 k v}, b_{k v}\right)>$

$$
\mathrm{k} \in \mathrm{~K} \quad \mathrm{k} \in \mathrm{~K}
$$

$$
=<\min \{1.0,1.0,0.5\}, \max \{0.0,0.0,0.0\}>
$$

$$
=<0.5,0.0>\text {. }
$$

Thus $\mathrm{x}=\left(\hat{x}_{1}, \hat{x}_{2}, \hat{x}_{3}\right)=(<1.0,0.0>,<0.5,0.5>,<0.5,0.0>)$.
Hence ( $<0.5,0.0>,<0.5,0.5>,<0.5,0.0>$ ) $=(<1.0,0.0>(<0.5,0.0>,<0.5,0.5>$ $,<0.5,0.0>)+<0.5,0.5>(<0.0,1.0>,<1.0,0.0>,<0.5,0.5>)+<0.5,0.0$ $>(<0.0,1.0>,<0.5,0.5>,<1.0,0.0>$ )
Thus is the standard fuzzy linear combination of the basis vector $\left.\left.\mathrm{C}_{1}=(<0.5,0.0\rangle,<0.5,0.5\right\rangle,<0.5,0.0\right\rangle$ ). Similarly it can be verified for other basis vectors.
